Acronyms in This Document

A list of acronyms used in this document.

Acronym	Definition
CNN	Convolutional Neural Network
EVDK	Embedded Vision Development Kit
FPGA	Field-Programmable Gate Array
LED	light-emitting diode
MLE	Machine Learning Engine
SDHC	Secure Digital High Capacity
SDXC	Secure Digital eXtended Capacity
SPI	Serial Peripheral Interface
VIP	Video Interface Platform
USB	Universal Serial Bus

1. Introduction

This document provides technical information and instructions for setting up and running the EVDK Based Speed Limit Sign Detection Demo. This demo is designed to utilize the Lattice Machine Learning Engine (MLE) IP and implemented onto the Lattice Embedded Vision Development Kit (EVDK). The EVDK Based Speed Limit Sign Detection Demo performs the speed limit sign detection using the camera on the EVDK and feeds the video stream through the Convolutional Neural Network (CNN) inside Lattice MLE. The detected speed limit sign is reported through the HDMI output. The CNN in the Lattice MLE is trained with actual speed limit signs.

Refer to the following documents for detailed information on Lattice development boards and kit:

- [Lattice Embedded Vision Development Kit User Guide \(FPGA-UG-02015\)](#)
- [CrossLink VIP Input Bridge Board Evaluation Board User Guide \(FPGA-EB-02002\)](#)
- [ECP5 VIP Processor Board Evaluation Board User Guide \(FPGA-EB-02001\)](#)
- [HDMI VIP Output Bridge Board Evaluation Board User Guide \(FPGA-EB-02003\)](#)

2. Functional Description

The EVDK Based Speed Limit Sign Detection Demo is designed to utilize the Lattice Embedded Vision Development Kit with MicroSD Card Adapter Board, as shown in [Figure 2.1](#).

Figure 2.1. Lattice EVDK with MicroSD Card Adapter Board

The Lattice Embedded Vision Development Kit features a stackable modular architecture consisting of three boards:

- CrossLink Video Interface Platform (VIP) Input Bridge Board
- ECP5 VIP Processor Board
- HDMI VIP Output Bridge Board

[Figure 2.1](#) shows Revision C of the Embedded Vision Development Kit. For earlier revisions, refer to the user guide of the specific evaluation board. For more information on the Embedded Vision Development Kit, visit the Lattice website [Embedded Vision Development Kit](#) page.

The firmware, which holds the CNN training results (from Tensorflow) is stored inside the SD card. The MLE detects the speed limit sign with the possibility value. The results are overlaid onto the input image and sent out through the HDMI port.

As shown in [Figure 2.2](#), the video data taken by the camera sensor (CN2) on the CrossLink VIP Input Bridge Board are fed into the ECP5 VIP Processor Board where the MLE processes the image data. This data, with weights and biases from the firmware, is used to compute for possibility if the speed limit signs are detected. The results, along with the input images are sent to the HDMI output through the HDMI VIP Output Bridge Board.

The Speed Limit Sign Detection Demo is designed to detect speed limit signs for 25, 30, 35, 40, 45, 50, 55, 60 and 65 miles per hour.

Figure 2.2. Speed Limit Sign Detection Demo Diagram

3. Demo Setup

This section describes the demo setup.

3.1. Hardware Requirements

- Lattice Embedded Vision Development Kit (LF-EVDK1-EVN)
 - Mini-USB Cable (Included in the kit)
 - 12 V Power Supply (Included in the kit)
- HDMI Cable
- HDMI Monitor (1080p60)
- Machine Learning Adapter Card (ML-EVN-ADP)
 - The microSD Card Adapter (MICROSD-ADP-EVN) has been replaced by the Machine Learning Adapter Card (ML-EVN-ADP). The Machine Learning Adapter card includes an optional microphone input, but is otherwise a 100% functional replacement for the microSD Card Adapter.
- MicroSD Card (Standard only - less than 2 GB, not SDHC/SDXC/and others)

3.2. Software and Firmware Requirements

- Diamond Programmer (Refer to www.latticesemi.com/programmer)
- Bitstream files for programming the Embedded Vision Development Kit
 - Dual_Camera_to_Parallel_Crosslink.bit (targets CrossLink)
 - VIP-SpeedSignDetect.bit (targets ECP5)
- MicroSD card Image writer software (Win32diskimager)
 - URL link: <https://sourceforge.net/projects/win32diskimager/>
- MicroSD card image
- VIP-SpeedSignDetect.bin

3.3. Board Settings

Before programming the boards, perform the following steps:

1. On the ECP5 VIP Input Bridge Board, make sure the jumper settings are as shown in [Figure 3.1](#).
2. On the CrossLink VIP Processor Board ([Figure 3.2](#)), ensure that SW2 is ON to power the board (LEDs should be ON).
3. Connect the 12 V power supply to the barrel plug J4.
4. Connect the mini-USB cable from the PC to the mini-USB connector J2.

Figure 3.1. Back View of ECP5 VIP Input Bridge Board

Figure 3.2. Top View of CrossLink VIP Input Bridge Board

4. Programming the Demo

Both the CrossLink VIP Input Bridge Board and the ECP5 VIP Processor Board must be configured and programmed. Also, the demo design firmware must be programmed onto the MicroSD card which is plugged into the MicroSD Card Adaptor Board.

4.1. Programming the ECP5 SPI Flash

4.1.1. Erasing the ECP5 SRAM Prior to Reprogramming

If the ECP5 device is already programmed (either directly or loaded from SPI Flash), erase the ECP5 SRAM before reprogramming the ECP5 SPI Flash. Keep the board powered on to prevent reloading on reboot.

To erase the ECP5 SRAM:

1. Start Diamond Programmer. In the **Getting Started** dialog box, select **Create a new blank project**.
2. Click **OK**.
3. In the Diamond Programmer main interface, select **ECP5UM** in **Device Family** and **LFE5UM-85F** in **Device** as shown in [Figure 4.1](#).

Figure 4.1. Device Selection

4. Click the ECP5 row and select **Edit > Device Properties**.
5. In the **Device Properties** dialog box, select **JTAG 1532 Mode** in **Access mode** and **Erase Only** in **Operation** (shown in [Figure 4.2](#)).

Figure 4.2. Device Operation

6. Click **OK** to close the **Device Properties** dialog box.

7. In the Diamond Programmer main interface, click the **Program** button  to start the Erase operation.

Note: If you power OFF/ON the board, the SPI Flash reprograms the ECP5 device. In this case, you have to repeat steps 1 to 7.

4.1.2. Programming the ECP5 VIP Processor Board

To program the ECP5 VIP Processor Board:

1. Ensure that the ECP5 device is erased by performing the steps in [Erasing the ECP5 SRAM Prior to Reprogramming](#).
2. In the Diamond Programmer main interface, click the ECP5 row and select **Edit > Device Properties** to open the **Device Properties** dialog box as shown in [Figure 4.3](#).

Figure 4.3. Selecting General Options

3. Apply the settings below:
 - a. Under **Device Operation**, select the options below:
 - Access Mode: **SPI Flash Programming**
 - Operation: **SPI Flash Erase, Program, Verify**
 - b. Under **Programming Options**, select the bitstream file **~/Demonstration/VIP-SpeedSignDetect.bit** in **Programming file**.
 - c. Under **SPI Flash Options**, select the options below based on the board revision.
Revision B
 - Family: **SPI Serial Flash**
 - Vendor: **Micron**
 - Device: **SPI-N25Q128A**
 - Package: **8-pin SO8****Revision C**
 - Family: **SPI Serial Flash (SPI Serial Flash Beta for Diamond 3.10 or earlier)**
 - Vendor: **Macronix**
 - Device: **MX25L12835F**
 - Package: **8-Land WSON**
 - d. Click **Load from File** to update the **Data file size (Bytes)** value.
 - e. Ensure that the following addresses are correct:
 - Start Address (Hex): **0x00000000**
 - End Address (Hex): **0x001D0000**
4. Click **OK**.
5. In the Diamond Programmer main interface, click the **Program** button  to start the programming operation. Successful programming is displayed in the Diamond Programmer **Output** console as shown in [Figure 4.4](#).

Figure 4.4. Output Console

4.2. Programming the CrossLink SPI Flash

4.2.1. Erasing the CrossLink SRAM Prior to Reprogramming

If the CrossLink is already programmed (either directly or loaded from SPI Flash), erase the CrossLink SRAM before reprogramming the CrossLink SPI Flash. Keep the board powered on to prevent reloading on reboot.

To erase the CrossLink device SRAM:

1. Start Diamond Programmer. In the **Getting Started** dialog box, select **Create a new blank project**.
2. Click **OK**.
3. In the Diamond Programmer main interface, select **LIFMD** in **Device Family** and **LIF-MD6000** in **Device** as shown in Figure 4.5.

Figure 4.5. Device Selection

4. Click the CrossLink row and select **Edit > Device Properties**.
5. In the **Device Properties** dialog box, select **SSPI SRAM Programming** in **Access mode** and **Erase Only** in **Operation** as shown in Figure 4.6.

Figure 4.6. Device Operation

6. Click **OK** to close the **Device Properties** dialog box.
7. In the Diamond Programmer main interface, click the **Program** button  to start the erase operation.

Note: If you power OFF/ON the board, the SPI Flash reprograms the CrossLink device. In this case, you have to repeat steps 1 to 7.

4.2.2. Programming the CrossLink VIP Input Bridge Board

To program the CrossLink VIP Input Bridge Board:

1. Ensure that the CrossLink device SRAM is erased by performing the steps in [Programming the Demo](#).
2. In the Diamond Programmer main interface, click the CrossLink row and select **Edit > Device Properties** to open the **Device Properties** dialog box as shown in [Figure 4.7](#).

Figure 4.7. Selecting General Options

3. Apply the settings below.
 - a. Under **Device Operation**, select the options below:
 - Access Mode: **SPI Flash Background Programming**
 - Operation: **Erase, Program, Verify**
 - b. Under **Programming Options**, select the bitstream file
`~/Demonstration/Dual_Camera_to_parallel_Crosslink.bit` in Programming file.
 - c. Under **SPI Flash Options**, select the options below based on the board revision.

Revision B

 - Family: **SPI Serial Flash**
 - Vendor: **Micron**
 - Device: **SPI-M25PX16**
 - Package: **8-pin S08W**

Revision C

Revision C board may be populated with one of the following devices:

Option 1

- Family: SPI Serial Flash (SPI Serial Flash Beta for Diamond 3.10 SP1 or earlier)
- Vendor: Micron
- Device: SPI-MT25QL128A
- Package: 8-pin SOP2

Option 2

- Family: SPI Serial Flash (SPI Serial Flash Beta for Diamond 3.10 SP1 or earlier)
- Vendor: Macronix
- Device: MX25L12835F
- Package: 8-Land WSON

- d. Click **Load from File** to update the **Data file size (Bytes)** value.
- e. Ensure that the following addresses are correct:
 - Start Address (Hex): 0x00000000
 - End Address (Hex): 0x00FF0000
4. Click **OK**.
5. In the Diamond Programmer main interface, click the **Program** button  to start the programming operation. Successful programming is displayed in the Diamond Programmer **Output** console as shown in [Figure 4.8](#).

Figure 4.8. Output Console

4.3. Programming the MicroSD Card Firmware

To write the image to the MicroSD Card:

1. Download and install the Win32diskimager Image Writer software from the following link: <https://sourceforge.net/projects/win32diskimager/>.
2. Use Win32diskimager to write the appropriate Flash image file to the SD memory card. Depending on your PC, you may need a separate adapter (not described in this document) to physically connect to the card. See the [Programming the Demo](#) section to determine the file for the specific demo.
3. Connect the MicroSD Card as shown in [Figure 4.9](#).

Figure 4.9. Connecting the MicroSD Card

4. In Win32 Disk Imager, select the image file `~/Demonstration/VIP-SpeedSignDetect.bin` as shown in Figure 4.10.
5. Select the card reader in **Device**.
6. Click **Write**.

Figure 4.10. Win32 Disk Imager

5. Running the Demo

To run the Speed Limit Sign Detection Demo:

1. Turn on the Lattice EVDK.
Press the System Reset button (SW3) on the CrossLink VIP Input Bridge Board if necessary.
2. The User LEDs (D7-D10) on the CrossLink VIP Input Bridge Board rolls back and forth indicating that the system is running.
3. Position a Speed Limit sign (either a print out or on a computer screen) in front of the camera sensor (CN2) on the CrossLink VIP Input Bridge Board. Adjust the distance of the Speed Limit sign so that it occupies less than 20% of the overall input image. This proportion is similar to actual Speed Limit signs as they appear in car dashboard camera as shown in [Figure 5.1](#).

Figure 5.1. Actual Speed Limit Sign Reference

In the demo output, vertical bars indicate the possibility of detected Speed Limit signs. These are overlaid onto the input image as sent out through the HDMI output. Refer to [Figure 5.2](#).

Figure 5.2. Speed Limit Sign Detection Demo Output

For assistance, submit a technical support case at www.latticesemi.com/techsupport.

Revision History

Revision 1.2, June 2021

Section	Change Summary
All	- Added Disclaimers page. - Updated the last page of this document.
Demo Setup	Added a sub-bullet point for Micro SD Card Adapter in Hardware Requirements section.

Revision 1.1, September 2018

Section	Change Summary
Programming the ECP5 VIP Processor Board	Revised SPI Flash Options settings for Revision C of the board.
Programming the CrossLink VIP Input Bridge Board	Revised SPI Flash Options settings for Revision C of the board.
Appendix A and Appendix B	Removed these sections.
All	Minor formatting changes.

Revision 1.0, May 2018

Section	Change Summary
All	Initial release.
