Acronyms in This Document

A list of acronyms used in this document.

Acronym	Definition
СКРТ	Checkpoint
FPGA	Field-Programmable Gate Array

1. Introduction

This document provides a quick guide on how to train a machine and create a frozen file for the Lattice Machine Learning development using the Lattice's Embedded Vision Development Kit. It assumes that the reader is familiar with the basic Lattice FPGA design flow and mainly focuses on the Machine Learning part of the overall development process. For detailed instructions of the design flow described in this document, refer to the Object Counting using Mobilenet CNN Accelerator IP (FPGA-RD-02067).

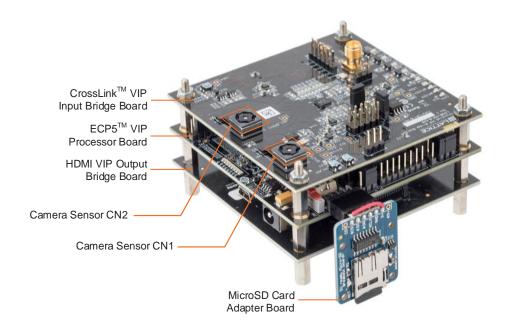

Figure 1.1. Lattice EVDK with MicroSD Card Adapter Board

1.1. Design Process Overview

The design process involves the following steps:

- Setting up the basic environment
- Preparing the dataset
- Training the machine
- Creating the frozen file (*.pb)
- Creating the binary file with Lattice sensAI™ 2.1 program
- Programming the binary and bitstream files to VIP board and SD card

5

2. Machine Training and Creating Frozen file

2.1. Verifying TensorFlow and Tool Environment

Check if TensorFlow and your tool environment is installed correctly. For the detailed procedure in creating the basic environment on PC, refer to the Setting up the Basic Environment section in Object Counting using Mobilenet CNN Accelerator IP (FPGA-RD-02067).

```
(venv) !l:~$ pip list | grep tensorflow tensorflow-estimator 1.13.0 tensorflow-gpu 1.13.1 (venv) dominatel:~$ □
```

Figure 2.1. TensorFlow Installation Check

2.2. Preparing the Dataset

Prepare the image and label data (KITTI format). The image size for this design is 224 x 224 pixels.

For the detailed procedure in preparing the dataset, refer to the Preparing the Dataset section in Object Counting using Mobilenet CNN Accelerator IP (FPGA-RD-02067).

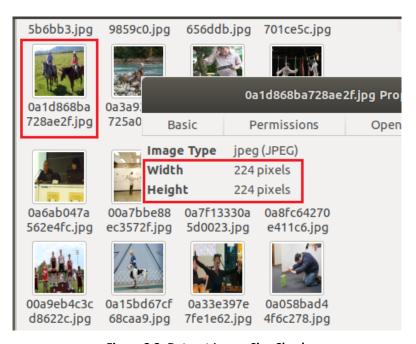

Figure 2.2. Dataset Image Size Check

2.3. Training the Machine

For the detailed procedure in machine training, refer to the Training the Machine section in Object Counting using Mobilenet CNN Accelerator IP (FPGA-RD-02067).

To train the machine:

1. Check the training dataset path in the training script file *train.sh*.

```
export GPUID=1
export NET="squeezeDet"
export TRAIN_DIR="./logs"

export TRAIN_DATA_DIR="/data/humancnt/"
```

Figure 2.3. Dataset Folder Path Check

The subdataset path can be set in the training code @src/dataset/kitti.py and can be used in combination with the --data_path option while triggering training using train.py to get the desired path. For example, you can have <data_path>/training/images and <data_path>/training/labels.

```
def __init__(self, image_set, data_path, mc):
    imdb.__init__(self, 'kitti_'+image_set, mc)
    self._image_set = image_set
    self._data_root_path = data_path
    self._image_path = os.path.join(self._data_root_path, 'training', 'images')
    self._label_path = os.path.join(self._data_root_path, 'training', 'labels')
    self._classes = self.mc.CLASS_NAMES
```

Figure 2.4. Dataset List, Image, and Label Data Path

2. Create a train.txt file.

```
$ cd data/humancnt/
$ python dataset_create.py
```

```
k$ python dataset_create.py
k$ _
```

Figure 2.5. Create a Label File

3. Run machine training. In the command prompt, execute ./run command.

Figure 2.6. Execute the script

Start TensorBoard.

```
$ tensorboard -logdir=<log directory of training>
```

For example: tensorboard -logdir='./logs/'

5. Open the local host port on your web browser.

```
earth:$ tensorboard --logdir logs/humancnt/train
TensorBoard 1.12.0 at http://earth:6006 (Press CTRL+C to quit)
```

Figure 2.7. TensorBoard – Generated Link

6. Check the training status on TensorBoard

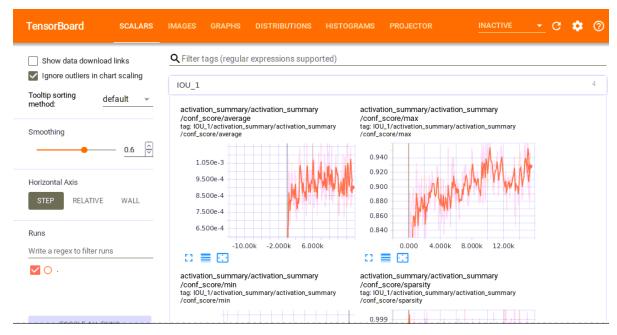

Figure 2.8. Training Status

Figure 2.9 shows the image menu of TensorBoard.

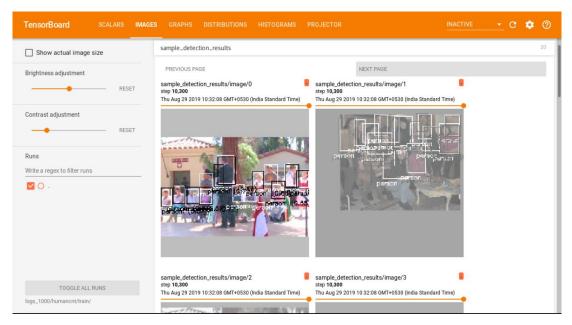

Figure 2.9. Image Menu

7. Check if the checkpoint, data, meta, index, and events (if using TensorBoard) files are created at the log directory. These files are used for creating the frozen file (*.pb).

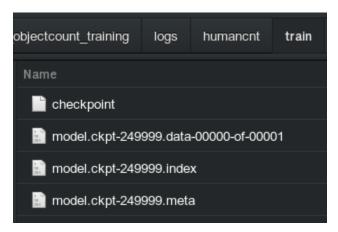

Figure 2.11 Checkpoint Data Files at Log Folder

2.4. Generating Frozen (*.pb) File

To generate frozen file (*.pb):

1. Run genpb.py.

\$ python src/genpb.py -ckpt_dir <log directory> --freeze

For example, python src/genpb.py -ckpt dir logs/humancnt/train --freeze

```
earth:$ python src/genpb.py --ckpt_dir logs/humancnt/train/ --freeze
genrating pbtxt
self.preds: Tensor("conv12/bias_add:0", shape=(20, 14, 14, 42), dtype=float32, device=/device:GPU:0)
ANCHOR_PER_GRID: 7
CLASSES: 1
ANCHORS: 1372
Using checkpoint: ./model.ckpt-249999
saved pbtxt at checkpoint direcory Path
inputShape shape [1, 224, 224, 3]
```

Figure 2.10. Create *.pbtxt File

2. Verify and find the generated frozen file.

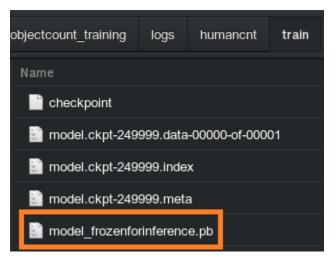

Figure 2.11. Check Frozen File

3. Generating the Binary File

For the detailed procedure in creating the binary file, refer to the Creating Binary File with sensAl section in Object Counting using Mobilenet CNN Accelerator IP (FPGA-RD-02067).

4. Programming the Bitstream and Binary files to VIP Board and SD Card

For the detailed procedure in flashing the bitstream file to the VIP board and flashing the binary file to the SD card, refer to Object Counting using Mobilenet CNN Accelerator IP (FPGA-RD-02067).
