A list of acronyms used in this document.

| Acronym | Definition |
|---------|------------|
| AP | Application Processor |
| DSP | Digital Signal Processor |
| ECC | Error Checking and Correction |
| FPGA | Field-Programmable Gate Array |
| JTAG | Joint Test Action Group |
| NVCM | Non-Volatile Configuration Memory |
| PIO | Programmable Input/Output |
| PLB | Programmable Logic Block |
| PLD | Programmable Logic Device |
| POR | Power On Reset |
| PROM | Programmable Read-Only Memory |
| SPI | Serial Peripheral Interface |
| SRAM | Static Random-Access Memory |

# 1. Introduction

The Mach™-NX programmable logic device (PLD) family sysI/O™ buffers are designed to meet the needs of flexible I/O standards in today's fast-paced design world. The supported I/O standards range from single-ended I/O standards to differential I/O standards so that you can easily interface your designs to standard buses, memory devices, video applications and emerging standards. This technical note provides a description of the supported I/O standards and the banking scheme for the Mach-NX PLD family. The sysI/O architecture and the software usage are also discussed to provide a better understanding of the I/O functionality and placement rules.

# 2. sysI/O Buffer Overview

The basic building block of the Mach-NX sysI/O is the Programmable I/O Cell (PIC) block. There are three types of PIC blocks in the Mach-NX device architecture. These include the basic PIC block, the receiving PIC block with gearing, and the transmitting PIC block with gearing. The PIC blocks with gearing are used for video and high-speed applications. The PIC blocks with gearing have a built-in control module for word alignment. The details of the gearing PIC block can be found in Implementing High-Speed Interfaces with Mach-NX Usage Guide (FPGA-TN-02234).

A common feature of all four types of PIC blocks is that each PIC block consists of four programmable I/O (PIOs). Each PIO includes a sysI/O buffer and an I/O logic block. A simplified sysI/O block diagram is shown in Figure 2.1. The I/O logic block consists of an input block, an output block, and a tri-state block. These blocks have registers, input delay cells, and the necessary control logic to support various operational modes. The sysI/O buffer determines the compliance to the supported I/O standards. It also supports features such as hysteresis to meet common design needs. The I/O logic block and the sysI/O buffer are designed with a minimal use of die area; providing easy bus interfacing, and pin out efficiency.

Two adjacent PIOs can form a pair of complementary output drivers. In addition, PIOA and PIOB of the PIC block form the primary pair of the buffer, while PIOC and PIOD form the alternate pair of the buffer. The primary pairs have additional capability that is not available on the alternate pair. The sysI/O buffers of the PIC block are equivalent when implemented as the single-ended I/O standards.

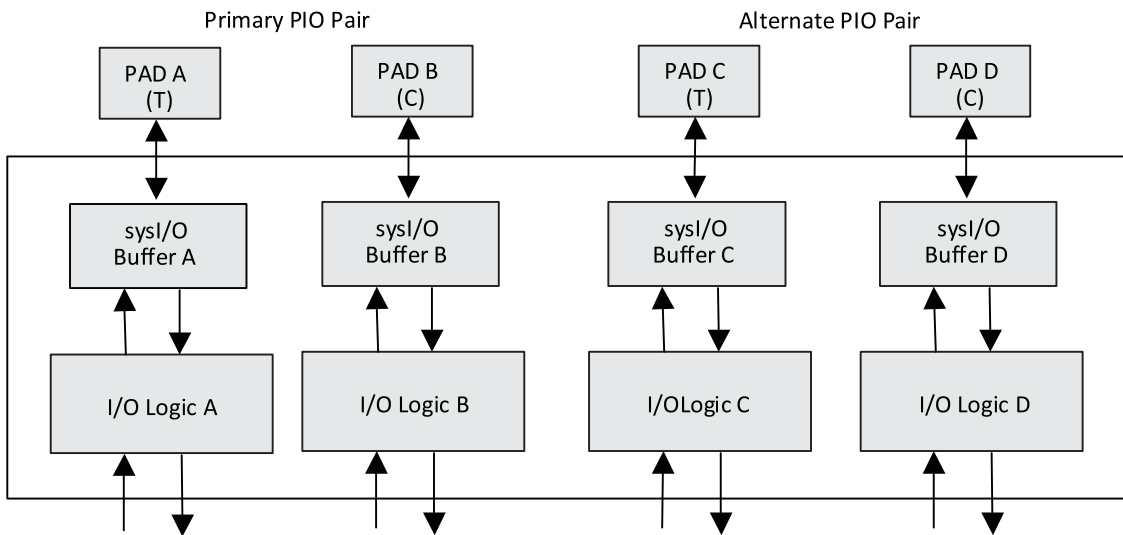

**Figure 2.1. PIC Block Diagram**

# 3. Supported sysI/O Standards

The Mach-NX sysI/O buffer supports both single-ended and differential standards. The internally ratioed standards support individually configurable drive strength and bus maintenance circuits, weak pull-up, weak pull-down, or bus keeper.

Bank 0, Bank 1, and Bank 2 of the Mach-NX device support true differential inputs, and emulated differential outputs using external resistors and the complementary LVCMOS outputs. The true-LVDS differential outputs and LVDS input termination are supported in specific banks as described in the sysI/O Banking Scheme section of this document.

**Table 3.1. Supported Input Standards**

| Input Standard | $V_{REF}$ (Nominal) | $V_{CCIO}$ [1] (Nominal) |
|---|---|---|
| **Single Ended Interfaces** | | |
| LVTTL33 | — | — |
| LVCMOS33 | — | — |
| LVCMOS25 | — | — |
| LVCMOS18 | — | — |
| LVCMOS15 | — | — |
| LVCMOS12 | — | — |
| **Differential Interfaces** | | |
| LVDS25 | — | — |
| LVPECL33 | — | — |
| MLVDS25 | — | — |
| BLVDS25 | — | — |
| LVTTL33D | — | — |
| MIPI[2] | — | — |

**Notes**:
1. If not specified, refer to mixed voltage support in Table 7.1.
2. This interface can be emulated with external resistors.

**Table 3.2. Supported Output Standards**

| Output Standard | Drive (mA) | $V_{CCIO}$ (Nominal) |
|---|---|---|
| **Single-ended Interfaces** | | |
| LVTTL33 | 4, 8, 12, 16 | 3.3 |
| LVCMOS33 | 4, 8, 12, 16 | 3.3 |
| LVCMOS25 | 4, 8, 12 | 2.5 |
| LVCMOS18 | 4, 8, 12 | 1.8 |
| LVCMOS15 | 4, 8 | 1.5 |
| LVCMOS12 | 2, 6 | 1.2 |
| **Differential Interfaces** | | |
| LVDS25 | 3.5 | 2.5, 3.3 |
| LVDS25E | 8 | 2.5 |
| LVPECL33E | 16 | 3.3 |
| MLVDS25E | 16 | 2.5 |
| BLVDS25E | 16 | 2.5 |
| LVTTL33 Differential | 4, 8, 12, 16 | 3.3 |
| LVCMOS33 Differential | 4, 8, 12, 16 | 3.3 |
| LVCMOS25 Differential | 4, 8, 12 | 2.5 |
| MIPI* | 2 | 2.5 |

**\*Note**: This interface can be emulated with external resistors. Refer to MIPI D-PHY Interface IP (FPGA-RD-02040) for information on support for MIPI Input and Output.

# 4. sysI/O Banking Scheme

The Mach-NX device has seven banks. Bank 0, Bank 1, and Bank 2 are sysI/O banks. It supports true LVDS differential outputs through the primary pairs in Bank 0. This device also supports 100 Ω differential input termination on every I/O pair in Bank 2.

Each of the I/O pins on all Mach-NX PLDs has a clamp feature which can be disabled or enabled. This clamp is similar to the PCI clamp but it is not PCI compliant. The arrangements of the banks are shown in Figure 4.1.

**Figure 4.1. Mach-NX I/O Banking Arrangement**

# 5. sysI/O Standards Supported by I/O Banks

All sysI/O banks can support multiple I/O standards under the $V_{CCIO}$ rules discussed above. Table 5.1 and Table 5.2 summarize the I/O standards supported on various banks of the Mach-NX device.

**Table 5.1. Single-Ended I/O Standards Supported on Various Banks**

| Standard | Bank 0 | Bank 1 | Bank 2 |
|---|---|---|---|
| LVTTL33 | Yes | Yes | No |
| LVCMOS33 | Yes | Yes | No |
| LVCMOS25 | Yes | Yes | No |
| LVCMOS18 | No | Yes | Yes |
| LVCMOS15 | No | Yes | Yes |
| LVCMOS12 | No | Yes | Yes |

**Table 5.2. Differential I/O Standards Supported on Various Banks**

| Standard | Bank 0 | Bank 1 | Bank 2 |
|---|---|---|---|
| LVDS output | Yes[1] | — | — |
| LVPECL33E[2] | Yes | Yes | Yes |
| MLVDS25E[2] | Yes | Yes | Yes |
| BLVDS25E[2] | Yes | Yes | Yes |
| LVDS25E[2] | Yes | Yes | Yes |
| LVTTL33D output | Yes | Yes | Yes |
| LVCMOS33D output | Yes | Yes | Yes |
| LVCMOS25D output | Yes | Yes | Yes |
| LVDS input | Yes | Yes | Yes |
| LVPECL33 input | Yes | Yes | Yes |
| MLVDS25 input | Yes | Yes | Yes |
| BLVDS25 input | Yes | Yes | Yes |
| LVTTL33D input | Yes | Yes | Yes |
| LVCMOS33D input | Yes | Yes | Yes |
| LVCMOS25D input | Yes | Yes | Yes |
| MIPI | No | Yes | Yes |

**Notes:**
1. True LVDS output is supported at the top bank.
2. Emulated output standards are denoted with a trailing "E" in the name of the standard.

# 6. Power Supply Requirements

The Mach-NX device has a simplified power supply scheme for sysI/O buffers. The core power $V_{CC}$ and the bank power $V_{CCIO}$ are the two main power supplies. The JTAG programming pins are powered by $V_{CCIO}$ in bank 0 where the JTAG pins reside. All the user sysI/O have a weak pull-down after power-up is complete and before the device configuration is done.

# 7. $V_{CCIO}$ Requirement for I/O Standards

Each I/O bank of a Mach-NX device has a separate $V_{CCIO}$ supply pin that can be connected to 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V. This voltage is used to power the output I/O standard and source the drive strength for the output. In addition to this, $V_{CCIO}$ also powers the ratioed input buffers such as LVTTL and LVCMOS. This ensures that the threshold of the input buffers is tracking the $V_{CCIO}$ voltage level.

Input buffer set up to be a 1.2 V ratioed input can be used on bank set to any $V_{CCIO}$. This is possible because the Mach-NX sysI/O buffer has two ratioed input buffers connected to $V_{CCIO}$ and $V_{CC}$ in parallel.

**Table 7.1 Mixed Voltage Support for LVCMOS and LVTTL I/O Types[8]**

| $V_{CCIO}$ | Inputs | | | | | | Outputs | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1.0 V | 1.2 V | 1.5 V | 1.8 V | 2.5 V | 3.3 V | 1.0 V | 1.2 V | 1.5 V | 1.8 V | 2.5 V | 3.3 V |
| 1.2 V | — | Yes | Yes[6] | — | — | — | — | Yes | — | — | — | — |
| 1.5 V | — | Yes[1] | Yes | Yes[6] | Yes[6] | Yes[6] | — | — | Yes | — | — | — |
| 1.8 V | — | Yes[1] | Yes[5] | Yes | Yes[6] | Yes[6] | — | — | — | Yes | — | — |
| 2.5 V | Yes[1, 9] | Yes[1, 10] | Yes[2, 5, 7] | Yes[3, 5, 7] | Yes | Yes[6] | Yes[11] | Yes[11] | — | — | Yes | — |
| 3.3 V | Yes[1, 9] | Yes[1, 10] | Yes[2, 5, 7] | Yes[3, 5, 7] | Yes[4, 5, 7] | Yes | Yes[11] | Yes[11] | — | — | — | Yes |

**Notes:**
1. Leakage occurs if bus hold or weak pull-up is turned on.
2. This input standard can be supported using the ratioed input buffer in under-drive conditions or using the I/O types LVCMOS15R25 or LVCMOS15R33 with the referenced input buffer.
3. This input standard can be supported using the ratioed input buffer in under-drive conditions or using the I/O type LVCMOS18R25 or LVCMOS18R33 with the referenced input buffer.
4. This input standard can be supported using the ratioed input buffer in under-drive conditions or using the I/O type LVCMOS25R33 with the referenced input buffer.
5. Under-drive condition when using the ratioed input buffer and the input standard voltage is below Vccio
    a. Under-drive causes higher DC current when the I/O is at logic high. It is recommended to use Power Calculator to estimate the power consumption under such condition.
    b. Hysteresis is not supported. In the Diamond software, HYSTERESIS must be set to NA.
    c. CLAMP is not supported. In the Diamond software, CLAMP must be set to OFF.
    d. I/O termination is not supported. In the Diamond software, PULLMODE must be set to NONE.
6. Over-drive condition when using the ratioed input buffer and the input standard voltage is above Vccio
    a. Hysteresis is not supported. In the Diamond software, HYSTERESIS must be set to NA.
    b. CLAMP is not supported. In the Diamond software, CLAMP must be set to OFF.
    c. I/O termination is not supported. In the Diamond software, PULLMODE must be set to NONE.
7. Ratioed input buffer in under-drive conditions is preferred over referenced input buffer due to lower power requirement for the ratioed input buffer.
8. When using the ratioed input buffers in under-drive or over-drive conditions, the HYSTERESIS setting shall be NA, the CLAMP setting shall be OFF, and the UP and KEEPER PULLMODE settings are not supported.
9. This input standard can be supported using the I/O types LVCMOS10R25 or LVCMOS10R33 with the referenced input buffer.
10. This input standard can be supported using the ratioed input buffer in under-drive conditions or using the I/O types LVCMOS12R25 or LVCMOS12R33 with the referenced input buffer.
11. This output standard is supported as a Bidirectional open-drain buffer only. I/O termination is not supported. In the Diamond software, OPENDRAIN must be set to ON, PULLMODE must be set to NONE, and CLAMP must be set to OFF.

For differential input standards, certain mixed voltage support is allowed in the architecture as shown in Table 7.2.

**Table 7.2 Mixed Voltage Support for Differential Input Standards**

| V$_{CCIO}$ | Differential Inputs | | |
|---|---|---|---|
| | LVDS<br>LVPECL33<br>MLVDS25<br>BLVDS25 | LVTTL33D<br>LVCMOS33D | LVCMOS25D |
| 1.2 V | — | — | — |
| 1.5 V | — | — | — |
| 1.8 V | — | — | — |
| 2.5 V | Yes | — | Yes |
| 3.3 V | Yes | Yes | Yes |

# 8. Input Reference Voltage

To support Mixed Voltage I/O using the referenced input buffer, each sysI/O bank supports one reference voltage (VREF). Any I/O in the bank can be configured as the input reference voltage pin. This pin is a regular I/O if it is not used as reference voltage input. The input reference voltage can also be generated internally from the VREF generator. Again, there is one VREF generator per sysI/O bank and its programmable settings include OFF, 45% of V$_{CCIO}$, 50% of V$_{CCIO}$, and 55% of V$_{CCIO}$. Programming of the internal VREF generator and the external VREF pin cannot be set at the same time for a particular bank because there is only one VREF bus per sysI/O bank.

# 9. sysI/O Buffer Configuration

Each sysI/O buffer pair is made of two PIO buffers. PIO A and B pads form the primary pair, and PIO C and D pads form the alternate pair. Pads A and C of the pair are considered the "true" pad, while pads B and D are considered the "comp" pad. The "true" pad is associated with the positive side of the differential signal, while the "comp" pad is associated with the negative side of the differential signal.

All the PIO support bus maintenance circuitry to allow a weak pull-up, or a weak pulldown, or a weak bus keeper. The LVDS sysI/O buffer pairs have additional LVDS output drivers in the primary PIO and are available in Bank 0. The Bank 2 sysI/O buffer pairs have additional 100 Ω termination resistors between the "true" and "comp" pads.

## 9.1. LVCMOS Buffer Configurations

The LVCMOS buffers can be configured in a variety of modes to support common circuit design needs.

### 9.1.1. Bus Maintenance Circuit

Each pad has a weak pull-up, weak pull-down, and weak bus-keeper capability. These are selected with ON and OFF programmability. The pull-up and pull-down settings offer a fixed characteristic, which is useful in creating wired logic such as wired ORs. The bus-keeper option latches the signal in the last driven state, holding it at a valid level with minimal power dissipation. Input leakage can be minimized by turning off the bus maintenance circuitry. However, it is important to ensure that inputs are driven to a known state to avoid unnecessary power dissipation in the input buffer. The bus maintenance circuit is available for single-ended ratioed I/O standards.

### 9.1.2. Programmable Drive Strength

All single-ended drivers have programmable drive strength. This option can be set for each I/O independently. The drive strengths available for each I/O standard can be found in Table 10.2. The Mach-NX programmable drive architecture is guaranteed with minimum drive strength for each drive setting. The V/I curves in the data sheet provide details of output driving capability versus the output load. This information, together with the current per sysI/O bank and the package thermal limit current, should be taken into consideration when selecting the drive strength.

### 9.1.3. Input Hysteresis

VIH is the trip point for a low-to-high transition and VIL is the trip point for a high-to-low transition, hysteresis voltage is the difference between VIH and VIL. Hysteresis is used to prevent several quick successive changes if the input signal contains some noise, for example. The noise could mean that you cross the trip point more than just once, which causes a glitch in the system.

All ratioed input receivers, except LVCMOS12, support input hysteresis. The input hysteresis for the LVCMOS33, LVCMOS25, LVCMOS18 and LVCMOS15 have two settings for flexibility. The ratioed input receivers have no input hysteresis when they are operated in under-drive or over-drive input conditions as shown in Table 10.1.

### 9.1.4. Programmable Slew Rate

The single-ended output buffer for each device I/O pin has programmable output slew rate control that can be configured for either low noise (SLEWRATE=SLOW) or high speed (SLEWRATE=FAST) performance. Each I/O pin has an individual slew rate control. This slew rate control affects both the rising edge and the falling edges. The rise and fall ramp rates for each I/O standard can be found in the in the device IBIS file for a given I/O configuration.

### 9.1.5. Tri-state and Open Drain Control

Each single-ended output driver has a separate tri-state control in addition to the global tri-state control for the device. The single-ended output drivers also support open drain operation on each I/O independently. The open drain output is typically pulled up externally and only the sink current specification is maintained.

## 9.2. Differential Buffer Configurations

The sysI/O buffer pair supports differential input standards. Bank 0 and Bank 2 support some additional functions over those supported by the base sysI/O buffer pairs.

### 9.2.1. Differential Receivers

All the sysI/O buffer pairs support differential input on all edges of the device. When a sysI/O buffer pair is configured as differential receiver, the input hysteresis and the bus maintenance capabilities are disabled for the buffer.

### 9.2.2. On-Chip Input Termination

The Mach-NX device supports on-chip 100 Ω (nominal) input differential termination in Bank 2 I/O. The termination is available on all input PIO pairs of Bank 2 and is programmable.

### 9.2.3. Emulated Differential Outputs

All sysI/O buffer pairs support complementary outputs as described above. This feature can be used to drive complementary LVCMOS signals. It can also be used together with off-chip resistor networks for emulating the differential output standards such as LVPECL, MLVDS, MIPI and BLVDS differential standards. When a sysI/O buffer pair is configured as differential transmitter, the bus maintenance and open drain capabilities are disabled. All single-ended sysI/O buffers pairs in the Mach-NX can support emulated differential output standards.

## 9.3. True Differential Output and Output Drive

Mach-NX supports true differential output drivers on the top edge of the device. These true differential outputs are only available on the primary PIO pairs. The output driver has a fixed common mode of 1.2 V and a programmable drive current of 3.5 mA. The bank $V_{CCIO}$ for true differential output can be 2.5 V or 3.3 V.

# 10. Software sysI/O Attributes

The sysI/O attributes or primitives must be used in the Lattice development software to control the functions and capabilities of the sysI/O buffers. sysI/O attributes or primitives can be specified in the HDL source code, in the Lattice Diamond™ Spreadsheet View interface, or in the ASCII preference file (.lpf) file directly. Appendix A, Appendix B, and Appendix C list examples of using such attributes in different environments. This section describes each of these attributes in detail.

## 10.1. HDL Attributes

All the attributes discussed in this section, except two, can be used in the HDL source code to direct the sysI/O buffer functionality.

### 10.1.1. IO_TYPE

This attribute is used to set the sysI/O standard for an I/O. The $V_{CCIO}$ required to set these I/O standards are embedded in the attribute names. The BANK $V_{CCIO}$ attribute is used to specify allowed $V_{CCIO}$ combinations for each I/O type. Table 10.1 shows the valid I/O types for the Mach-NX.

**Table 10.1. Supported I/O Types**

| sysI/O Signaling Standard | IO_TYPE |
|---|---|
| LVDS 2.5 V | LVDS25 |
| Emulated LVDS 2.5 V[1] | LVDS25E |
| Bus LVDS 2.5 V | BLVDS25 |
| Emulated Bus LVDS 2.5 V[1] | BLVDS25E |
| MLVDS 2.5 V | MLVDS25 |
| Emulated MLVDS 2.5 V[1] | MLVDS25E |
| LVPECL 3.3 V | LVPECL33 |
| Emulated LVPECL 3.3 V[1] | LVPECL33E |
| LVTTL 3.3 V | LVTTL33 |
| LVTTL 3.3 V differential[2] | LVTTL33D |
| LVCMOS 3.3 V | LVCMOS33 |
| LVCMOS 3.3 V differential[2] | LVCMOS33D |
| LVCMOS 2.5 V (default) | LVCMOS25 |
| LVCMOS 2.5 V differential[2] | LVCMOS25D |
| LVCMOS 2.5 V in 3.3 V VCCIO bank[3] | LVCMOS25R33 |
| LVCMOS 1.8 V | LVCMOS18 |
| LVCMOS 1.8 V in 3.3 V VCCIO bank[3] | LVCMOS18R33 |
| LVCMOS 1.8 V in 2.5 V VCCIO bank[3] | LVCMOS18R25 |
| LVCMOS 1.5 V | LVCMOS15 |
| LVCMOS 1.5 V in 3.3 V VCCIO bank[3] | LVCMOS15R33 |
| LVTTL 3.3 V | LVTTL33 |
| LVCMOS 1.5 V in 2.5 V VCCIO bank[3] | LVCMOS15R25 |
| LVCMOS 1.2 V | LVCMOS12 |
| LVCMOS 1.2 V in 3.3 V VCCIO bank[4] | LVCMOS12R33 |
| LVCMOS 1.2 V in 2.5 V VCCIO bank[4] | LVCMOS12R25 |
| LVCMOS 1.0 V in 3.3 V VCCIO bank[4] | LVCMOS10R33 |
| LVCMOS 1.0 V in 2.5 V VCCIO bank[4] | LVCMOS10R25 |
| MIPI | MIPI |

**Notes:**
1. These differential output standards are emulated by using a complementary LVCMOS driver pair together with an external resistor pack.
2. These differential standards are implemented by using a complementary LVCMOS driver pair.
3. These are input only and require VREF to be set to certain value to allow the specified I/O types to be used.
4. These are input or bidirectional only and require VREF to be set to certain value to allow the specified I/O types to be used.

### 10.1.2. DRIVE

The DRIVE strength attribute is available for the output and bidirectional I/O standards. The default drive value depends on the I/O standard used. Table 10.2 shows the supported drive strength for the single-ended I/O types under designated $V_{CCIO}$ conditions.

**Table 10.2. Output Drive Capability for Ratioed sysI/O Standards**

| $V_{CCIO}$ | I/O Type | | | | | |
|---|---|---|---|---|---|---|
| | LVCMOS12 | LVCMOS15 | LVCMOS18 | LVCMOS25 | LVCMOS33 | LVTTL33 |
| 2 | YES | — | — | — | — | — |
| 4 | — | YES | YES | YES | YES | YES |
| 6 | YES | — | — | — | — | — |
| 8 | — | YES | YES | YES | YES | YES |
| 12 | — | — | YES | YES | YES | YES |
| 16 | — | — | — | YES | YES | YES |

### 10.1.3. DIFFDRIVE

The DIFFDRIVE strength attribute is available for the true LVDS output standard. All true LVDS differential drivers on the top edge is set to 3.5 mA setting. This is not programmable on the Mach-NX device.

Values: 3.5

Default: 3.5

### 10.1.4. PULLMODE

The PULLMODE option can be enabled or disabled independently for each I/O. When you select OPENDRAIN=ON, the PULLMODE for the output standard is default to NONE. When you select the I/O type as I3C, the PULLMODE for the output standard is forced to be I3C for the dynamic control capability.

Values: UP, DOWN, NONE, KEEPER, I3C

Default: DOWN for LVTTL, and LVCMOS, I3C for I3C33/I3C18/I3C12; all others NONE

### 10.1.5. CLAMP

The CLAMP option can be enabled or disabled independently for each I/O. The settings are available in Bank 2. All other I/O have ON or OFF settings for this attribute.

Values: OFF, ON

Default: OFF

### 10.1.6. HYSTERESIS

The ratioed input buffers have two input hysteresis settings. The HYSTERESIS option can be used to change the amount of hysteresis for the LVTTL and LVCMOS input and bidirectional I/O standards, except for the LVCMOS12 inputs. The LVCMOS12 inputs do not support HYSTERESIS.

The LVCMOS25R33, LVCMOS18R25, LVCMOS18R33, LVCMOS15R25, LVCMOS15R33, LVCMOS12R33, LVCMOS12R25, LVCMOS10R33, and LVCMOS10R25 input types do not support HYSTERESIS. The HYSTERESIS option for each of the input pins can be set independently when it is supported for the I/O type.

Values: SMALL, LARGE, NA

Default: SMALL

### 10.1.7. VREF

The VREF option is enabled for referenced LVCMOS input buffers. The referenced LVCMOS input buffers are specified by choosing the I/O type as LVCMOS25R33, LVCMOS18R25, LVCMOS18R33, LVCMOS15R25, LVCMOS15R33, LVCMOS12R33, LVCMOS12R25, LVCMOS10R33, or LVCMOS10R25. The default value of NA applies for all I/O types that do not use a VREF signal.

The VREF defaults to external VREF pin for the single-ended LVCMOS25R33, LVCMOS18R25, LVCMOS18R33, LVCMOS15R25, LVCMOS15R33, LVCMOS12R33, LVCMOS12R25, LVCMOS10R33, or LVCMOS10R25 inputs. You may enter a VREF_NAME value in the "VREF Location(s)" pop-up window of the Spreadsheet View of the Diamond software. In doing so, the software presents the VREF_NAME as an available value in additional to the I45, I50 and I55 values in the VREF column of the Port Assignments tab of the Diamond Spreadsheet View. A pin location specified by the VREF_NAME value is used as the VREF driver for that sysI/O bank. VREF_NAME is only necessary if you want to specify a pin to be used as an external VREF pin. Otherwise, the software automatically assigns a pin for the VREF signal.

There is only one VREF pin or internal VREF driver per sysI/O bank. Only one of the VREF driver settings chosen from I45, I50, I55 or VREF1_LOAD can be used in each sysI/O bank. This attribute can be set in the software interface or in the ASCII preference file.

Values: OFF, I45, I50, I55, VREF_NAME

Software Default: NA

Hardware Default (Erased): OFF

### 10.1.8. OPENDRAIN

The OPENDRAIN option is available for all LVTTL and LVCMOS output and bidirectional I/O standards. Each sysI/O can be assigned independently to be open drain, except I3C I/O type. When the OPENDRAIN attribute is used, the PULLMODE must be NONE and the CLAMP must be OFF.

Values: OFF, ON Default: OFF

### 10.1.9. SLEWRATE

Each I/O pin has an individual slew rate control. This allows the designer to specify slew rate control on a pin-by-pin basis for outputs and bidirectional I/O pins. This is not a valid attribute for inputs or true differential outputs.

Values: FAST, SLOW, NA

Default: FAST

### 10.1.10. DIFFRESISTOR

The I/O pins support on-chip differential input termination resistors. The termination resistor is available for both the primary pair and the alternate pair of a sysI/O. The values supported are zero (OFF) or 100 Ω.

Values: OFF, 100

Default: OFF

### 10.1.11. DIN/DOUT

The DIN/DOUT option is available for each I/O and can be configured independently. An input register is used for the input if the DIN attribute is assigned. Similarly, the software assigns an output register when the DOUT attribute is specified. By default, the software automatically assigns DIN or DOUT to input or output registers if possible.

### 10.1.12. LOC

This attribute specifies the site location for the component after the mapping process. When attached to multiple components, it indicates that these blocks are to be mapped together in the specified site. It specifies the PIC site for the pad when it is assigned to a pad. The LOC attribute can be attached to components that will end up on an I/O cell, clocks, and internal flip-flops, but it should not be attached to combinational logic that will end up on a logic cell; doing so could fail to generate a locate preference. The LOC attribute overrides register ordering.

### 10.1.13. Bank V<sub>CCIO</sub>

This attribute is necessary to verify the valid I/O types for a bank, to determine which input buffer to use, and to set the correct drive strength for the applicable I/O types. Since the I/O bank information is not required at the HDL level, this attribute is available through either the Diamond software's Spreadsheet View or in the ASCII preference file.

Values: AUTO, 3.3, 2.5, 1.8, 1.5, 1.2.

Default: AUTO.

### 10.1.14. sysI/O Primitives

There are many sysI/O primitives in the software library. A few are selected to be discussed in this section because some sysI/O capabilities can only be utilized through instantiating the primitives in the HDL source code.

### 10.1.15. Tri-State All (TSALL)

The Mach-NX device supports the TSALL function that is used to enable or disable the tristate control to all the output buffers. You can choose to assign any general purpose I/O pin to control the TSALL function since there is no dedicated TSALL pin. The TSALL primitive must be instantiated in the source code in order to enable the TSALL function. The input of the primitive can be assigned to an input pin or to an internal signal.

A value of TSALL=1 will tri-state all outputs but the outputs will be under individual OE control when TSALL=0

**Figure 10.1. TSALL Primitive**

### 10.1.16. Fixed Data Delay (DELAYE)

This primitive supports up to 32 steps of static delay for all sysI/O buffers in Bank 0, Bank 1, and Bank 2 of a Mach-NX device. Although you can choose USER_DEFINED mode to set input delay, this primitive is primarily used by pre-defined source synchronous interfaces as described in Implementing High-Speed Interfaces with Mach-NX Usage Guide (FPGA-TN-02234).

**Figure 10.2. DELAYE Primitive and Associated Attributes**

**Table 10.3. Output Drive Capability for Ratioed sysI/O Standards**

| Attribute | Description | Value | Software Default |
|---|---|---|---|
| DEL_MODE | Fixed delay value depending on interface or user-defined delay values | SCLK_ZEROHOLD ECLK_ALIGNED ECLK_CENTERED SCLK_ALIGNED SCLK_CENTERED USER_DEFINED | USER_DEFINED |
| DEL_VALUE | User-defined value | DELAY0...DELAY31 | DELAY0 |

### 10.1.17. Dynamic Data Delay (DELAYD)

This primitive supports dynamic delay for the sysI/O buffers in Bank 2 of the Mach-NX device only. The 5-bit inputs can be controlled by user logic to modify the delay during the device operation.

**Figure 10.3. DELAYD Primitive**

# 11. Design Consideration and Usage

This section summarizes the Mach-NX designs rules and considerations that have been discussed in detail in previous sections. Table 11.1 lists the miscellaneous I/O features on each side of a Mach-NX device.

## 11.1. sysI/O Buffer Features Common to All Mach-NX Device

- Bank 0, Bank 1, and Bank 2 support true differential inputs.
- Bank 0, Bank 1, and Bank 2 support emulated differential outputs using external resistors and complementary LVCMOS ouputs. Emulated differential output buffers are supported on both primary and alternate pairs.
- Bank 0, Bank 1, and Bank 2 have programmable I/O clamps.
- Bank 0, Bank 1, and Bank 2 support weak pull-up, pull-down, and bus-keeper (bus hold latch) settings on each I/O independently.
- $V_{CCIO}$ voltage levels, together with the selected I/O types, determine the characteristics of an I/O, such as the pull mode, hysteresis, clamp behavior, and drive strength, supported in a bank. Each bank can support 1.2V inputs regardless of the $V_{CCIO}$ setting of the bank.
- Each bank supports one $V_{CCIO}$ signal.

## 11.2. sysI/O Buffer Rules

- Only Bank 0 supports true differential output buffers with programmable drive strengths. Only the primary pair supports true differential output buffers.
- Only Bank 2 supports internal 100 Ω differential input terminations.

**Table 11.1. Miscellaneous I/O Features**

| Feature | Bank 0 | Bank 1 | Bank 2 |
|---|---|---|---|
| 100 Ω Differential Resister | — | — | Yes |
| Hot Socket | Yes | Yes | Yes |
| Clamp[2] | Yes | Yes | Yes |
| Weak Pull-up[2] | Yes | Yes | Yes |
| Weak Pull-down[1] | Yes | Yes | Yes |
| Bus Keeper[2] | Yes | Yes | Yes |
| Input Hysteresis[2] | Yes | Yes | Yes |
| Slew Rate Control | Yes | Yes | Yes |
| Open Drain | Yes | Yes | Yes |
| Dynamic pull up control | — | — | — |

**Notes:**
1. Software default setting
2. I/O characteristic under special conditions:
   a. HYSTERESIS option is not available for LVCMOS12.
   b. HYSTERESIS option and BUS KEEPER option are not available for referenced input standards.
   c. When using the ratioed input buffers in under-drive or over-drive conditions, the HYSTERESIS setting shall be NA, the CLAMP setting shall be OFF, and the UP and KEEPER PULLMODE settings are not supported.
   d. HYSTERESIS and the bus maintenance capabilities are disabled for differential receivers.

# Appendix A.   sysI/O HDL Attributes

The sysI/O attributes can be used directly in the HDL source codes. This section provides a list of sysI/O attributes supported by the Mach-NX. The correct syntax and examples for the Synplify® synthesis tool are provided here for reference.

## A.1.   Attributes in VHDL Language

This section lists syntax and examples for the sysI/O attributes in VHDL.

**Syntax**

**Table A.1. VHDL Attribute Syntax**

| Attribute | Syntax |
|---|---|
| IO_TYPE | attribute IO_TYPE: string;<br>attribute IO_TYPE of *Pinname*: signal is *"IO_TYPE Value"*; |
| DRIVE | attribute DRIVE: string;<br>attribute DRIVE of *Pinname:* signal is *"Drive Value"*; |
| DIFFDRIVE | attribute DIFFDRIVE: string;<br>attribute DIFFDRIVE of *Pinname:* signal is *"Diffdrive Value"*; |
| DIFFRESISTOR | attribute DIFFRESISTOR: string;<br>attribute DIFFRESISTOR of *Pinname:* signal is *"Diffresistor Value"*; |
| CLAMP | attribute CLAMP: string;<br>attribute CLAMP of *Pinname:* signal is *"Clamp Value"*; |
| HYSTERESIS | attribute HYSTERESIS: string;<br>attribute HYSTERESIS of *Pinname:* signal is *"Hysteresis Value"*; |
| VREF | NA |
| PULLMODE | attribute PULLMODE: string;<br>attribute PULLMODE of *Pinname:* signal is *"Pullmode Value"*; |
| OPENDRAIN | attribute OPENDRAIN: string;<br>attribute OPENDRAIN of *Pinname:* signal is *"OpenDrain Value"*; |
| SLOWSLEW | attribute SLOWSLEW: string;<br>attribute SLOWSLEW of *Pinname:* signal is *"Slewrate Value"*; |
| DIN | attribute DIN: string;<br>attribute DIN of *Pinname*: signal is " "; |
| DOUT | attribute DOUT: string;<br>attribute DOUT of *Pinname:* signal is " "; |
| LOC | attribute LOC: string;<br>attribute LOC of *Pinname:* signal is "pin_locations"; |
| BANK VCCIO | NA |

**Examples**

**IO_TYPE**
```
--***Attribute Declaration*** ATTRIBUTE IO_TYPE: string;
--***IO_TYPE assignment for I/O Pin***
ATTRIBUTE IO_TYPE OF portB: SIGNAL IS "LVCMOS33";
ATTRIBUTE IO_TYPE OF portD: SIGNAL IS "LVDS25";
```

### DRIVE

```
--***Attribute Declaration***
ATTRIBUTE DRIVE: string;
--***DRIVE assignment for I/O Pin***
ATTRIBUTE DRIVE OF portB: SIGNAL IS "8";
```

### DIFFDRIVE

```
--***Attribute Declaration***
ATTRIBUTE DIFFDRIVE: string;
--*** DIFFDRIVE assignment for I/O Pin***
ATTRIBUTE DIFFDRIVE OF portD: SIGNAL IS "2.0";
```

### DIFFRESISTOR

```
--***Attribute Declaration***
ATTRIBUTE DIFFRESISTOR: string;
--*** DIFFRESISTOR assignment for I/O Pin***
ATTRIBUTE DIFFRESISTOR OF portD: SIGNAL IS "100";
```

### CLAMP

```
--***Attribute Declaration***
ATTRIBUTE CLAMP: string;
--*** CLAMP assignment for I/O Pin***
ATTRIBUTE CLAMP OF portA: SIGNAL IS "PCI33";
```

### HYSTERESIS

```
--***Attribute Declaration***
ATTRIBUTE HYSTERESIS: string;
--*** HYSTERESIS assignment for Input Pin***
ATTRIBUTE HYSTERESIS OF portA: SIGNAL IS " LARGE ";
```

### PULLMODE

```
--***Attribute Declaration***
ATTRIBUTE PULLMODE : string;
--***PULLMODE assignment for I/O Pin***
ATTRIBUTE PULLMODE OF portA: SIGNAL IS "DOWN";
ATTRIBUTE PULLMODE OF portB: SIGNAL IS "UP";
```

### OPENDRAIN

```
--***Attribute Declaration***
ATTRIBUTE OPENDRAIN: string;
--***Open Drain assignment for I/O Pin***
ATTRIBUTE OPENDRAIN OF portB: SIGNAL IS "ON";
```

### SLEWRATE

```
--***Attribute Declaration***
ATTRIBUTE SLEWRATE : string;
--*** SLEWRATE assignment for I/O Pin***
ATTRIBUTE SLEWRATE OF portB: SIGNAL IS "FAST";
```

### DIN/DOUT

```
--***Attribute Declaration***
ATTRIBUTE din : string; ATTRIBUTE dout : string;
--*** din/dout assignment for I/O Pin***
ATTRIBUTE din OF input_vector: SIGNAL IS "TRUE ";
ATTRIBUTE dout OF output_vector: SIGNAL IS "TRUE ";
```

**LOC**

```
--***Attribute Declaration***
ATTRIBUTE LOC : string;
--*** LOC assignment for I/O Pin***
ATTRIBUTE LOC OF input_vector: SIGNAL IS "E3,B3,C3 ";
```

# A.2.    Attribute in Verilog Language

This section lists syntax and examples for the sysI/O Attributes in Verilog.

**Syntax**

**Table A.2. Verilog Attribute Syntax**

| Attribute | Syntax |
|---|---|
| IO_TYPE | PinType PinName /* synthesis IO_Type="IO_Type Value"*/; |
| DRIVE | PinType PinName /* synthesis DRIVE="Drive Value"*/; |
| DIFFDRIVE | PinType PinName /* synthesis DIFFDRIVE =" DIFFDRIVE Value"*/; |
| DIFFRESISTOR | PinType PinName /* synthesis DIFFRESISTOR =" DIFFRESISTOR Value"*/; |
| CLAMP | PinType PinName /* synthesis CLAMP =" Clamp Value"*/; |
| HYSTERESIS | PinType PinName /*synthesis HYSTERESIS = "Hysteresis Value" */; |
| VREF | N/A |
| PULLMODE | PinType PinName /* synthesis PULLMODE="Pullmode Value"*/; |
| OPENDRAIN | PinType PinName /* synthesis OPENDRAIN ="OpenDrain Value"*/; |
| SLOWSLEW | PinType PinName /* synthesis SLEWRATE="Slewrate Value"*/; |
| DIN | PinType PinName /* synthesis DIN= "value" */; |
| DOUT | PinType PinName /* synthesis DOUT= "value" */; |
| LOC | PinType PinName /* synthesis LOC="pin_locations "*/; |
| Bank VCCIO | N/A |

**Examples**

**//IO_TYPE, PULLMODE, SLEWRATE and DRIVE assignment**
```
output portB /*synthesis IO_TYPE="LVCMOS33"
PULLMODE ="UP" SLEWRATE ="FAST" DRIVE ="20"*/;
output portC /*synthesis IO_TYPE="LVDS25" */;
```

**//DIFFDRIVE**
```
output portD /* synthesis IO_TYPE="LVDS25" DIFFDRIVE="2.0"*/;
```

**//DIFFRESISTOR**
```
output [4:0] portA /* synthesis IO_TYPE="LVDS25" DIFFRESISTOR ="100"*/;
```

**//CLAMP**
```
output portA /*synthesis IO_TYPE="LVCMOS33" CLAMP ="ON" */;
```

**//HYSTERESIS**
```
input mypin /* synthesis HYSTERESIS = "LARGE" */;
```

**//OPENDRAIN**
```
output portA /*synthesis OPENDRAIN ="ON"*/;
```

**// DIN Place the flip-flops near the load input**

```
input load /* synthesis din="" TRUE */;
```

**// DOUT Place the flip-flops near the outload output**

```
output outload /* synthesis dout="TRUE" */;
```

**//LOC pin location**

```
input [2:0] DATA0 /* synthesis loc="E3,B1,F3"*/;
```

**//LOC Register pin location**

```
reg data_in_ch1_buf_reg3 /* synthesis loc="R10C16" */;
```

**//LOC Vectored internal bus**

```
reg [3:0] data_in_ch1_reg /*synthesis loc ="R10C16,R10C15,R10C14,R10C9" */;
```

# Appendix B.    sysI/O Attributes Using the Spreadsheet View

The sysI/O buffer attributes can be assigned using the Spreadsheet View available in the Diamond design tool. The attributes that are not available as HDL attributes, such as Bank $V_{CCIO}$, are available in the Spreadsheet View interface.

The Port Assignment tab lists all the ports in a design and all the available sysI/O attributes as preferences. Click on each of these cells for a list of all the valid I/O preferences for that port. Each column takes precedence over the next. Therefore, when a particular IO_TYPE is chosen, the columns for the DRIVE, PULLMODE, SLEWRATE and other attributes list the valid combinations for that IO_TYPE. Pin locations can be locked using the Pin column of the Port Assignment tab. Right-clicking on a cell lists all the available pin locations. The Spreadsheet View can run a DRC check to check for incorrect sysI/O attribute assignments.

All the preferences assigned using the Spreadsheet View are written into the logical preference file (.lpf).

**Figure B.1. Port Assignment Tab of Spreadsheet View**

## B.1. Bank V<sub>CCIO</sub> Setting in Spreadsheet View

Bank $V_{CCIO}$ is editable in the Global Preference tab of the Spreadsheet View. The value of the Bank $V_{CCIO}$ can be chosen by the users to determine the value of $V_{CCIO}$ of a specific bank.

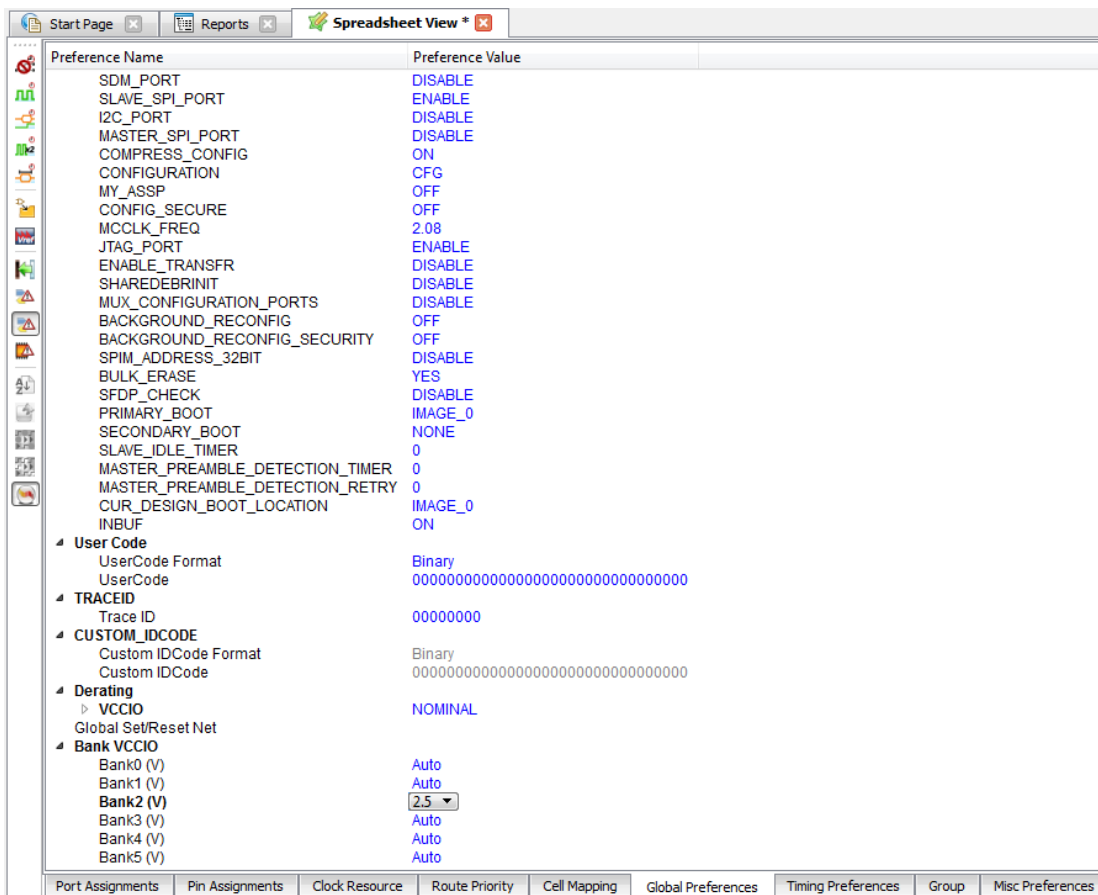

**Figure B.2. Bank V<sub>CCIO</sub> in Global Preference Tab**

# Appendix C. sysI/O Attributes Using Preference File (ASCII File)

Designers can enter sysI/O attributes directly in the preference (.lpf) file as sysI/O buffer preferences. The LPF file is a post-synthesis FPGA constraint file that stores logical preferences that have been created or modified in the Spreadsheet View or directly in a text editor. It also contains logical preferences originating in the HDL source. Modifying the Spreadsheet View in the Diamond software can automatically update the content of the LPF file and vice versa. The settings in the Spreadsheet View are reflected in the preference file once they are saved. Details of the supported preferences and their corresponding syntax can be found in the Diamond Help System.
